INTRODUCTION

This document shows how to connect to WaterOneFlow web services with VB.NET and Visual Studio 2008 by walking you through the creation of a simple program that downloads the latest streamflow values for the Colorado River at Austin, TX. The program accesses real-time streamflow data from the USGS National Water Information System (NWIS) via the WaterOneFlow web service at http://river.sdsc.edu/wateroneflow/NWIS/UnitValues.asmx

Computer and Skill Requirements

To complete this exercise, your computer must meet the following requirements:

- Working Internet connection
- Visual Studio 2008 software

This exercise assumes that you have some familiarity with the following software environments:

- Visual Studio 2008

PROCEDURE

In this exercise, you will create a windows application with one main window that allows the user to click to see what the average streamflow over the past few days is at the Colorado River at Austin, TX. The application lets the user specify the number of days for which data should be retrieved (up to 30 days back). The application then asks the NWIS Unit Values web service for streamflow values, and then computes the average of the returned values. The NWIS Unit Values web service returns real-time data for roughly the past 31 days. These data typically are recorded at 15-minute intervals.

2.1 Setting Up the Project

2. Click File | New | Project...

![Figure 1 Creating a New Project]

3. In the New Project window, set the following properties:
   a. Choose Visual Basic | Windows from Project Types.
   b. Select Windows Forms Application from Templates.
   c. Type “AustinStreamflow” as the Name.
   d. Set the location where you want to save the project, e.g., C:\Temp.
   e. Click OK.
A new project will open with a default form called Form1.

**Note**
If you did not choose Visual Basic as the default language when installing Visual Studio, you might find the template for Visual Basic projects under the “Other Languages” project type.

### 2.2 Creating the Web Reference

This project will make use of the NWIS Unit Values web service to retrieve streamflow values from the USGS stream gage on the Colorado River at Austin. The web service becomes available to the project after making a web reference to the service.

1. Click Project | Add Service Reference...
2. In the Add Service Reference window (below Address: ), type in the following URL:

   http://river.sdsc.edu/wateroneflow/NWIS/UnitValues.asmx

   ![Figure 4 Address Box](image)

3. Click Go. Visual Studio will navigate to the URL and verify that a web service is present.
4. Change the namespace from the default to NwisRealtime. This is the name by which you will reference the NWIS web service in your code.

   ![Figure 5 Add Service Reference Wizard](image)

5. Click OK.

The NWIS web service is now available for use within your project.

### 2.3 Building the User Interface

Now that you’ve set up the project, you’ll build the user interface by adding controls to the form. Later, you’ll add the code behind those controls which will perform the work.

1. Right click on Form1 and click Properties.
2. Change the Text property of the form to “Colorado River Streamflow”. This changes the name that appears in the title bar of the form.

3. Add two labels, one combo box, and one button to the form, at roughly the same positions as shown in the figure below.
4. In a manner similar to setting the Text property of the form, set the properties of the controls as shown below.

<table>
<thead>
<tr>
<th>Control</th>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label1</td>
<td>Text</td>
<td>This program computes the average streamflow in the Colorado River at Austin, TX, over the past few days. Specify the number of days to include in the computation with the drop down box below.</td>
</tr>
<tr>
<td></td>
<td>AutoSize</td>
<td>False</td>
</tr>
<tr>
<td>Label2</td>
<td>Text</td>
<td>Number of recent days to include in average:</td>
</tr>
<tr>
<td>ComboBox1</td>
<td>DropDownStyle</td>
<td>DropDownList</td>
</tr>
<tr>
<td>Button1</td>
<td>(Name)</td>
<td>btnCalculate</td>
</tr>
<tr>
<td></td>
<td>Text</td>
<td>Calculate Average Streamflow</td>
</tr>
</tbody>
</table>

Table 1: Form Properties to be Set

The form should now look similar to the one below.

![Figure 9 Final Form](image)

Now you will add the choice of 1 to 10 days to the combo box.

5. Click the properties for ComboBox1, and then select the Items property. Click the ellipsis next to (Collection).
6. Add the numbers 1 through 10 to the String Collection Editor window. This allows the user to select between 1 and 10 days to include in the computation of average streamflow.

Figure 10 ComboBox1 Properties

Figure 11 String Collection Editor Window

7. Click OK to close the String Collection Editor window.

2.4 Writing the Code

1. Double click the form (be sure and not to click on any of the controls that you have added to the form.) This opens the code editor, and creates stub code that will be run when the form opens.

```vbnet
Public Class Form1
    Private Sub Form1_Load(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles MyBase.Load
        End Sub
End Class
```

2. Add the following code to the Form1_Load procedure.
ComboBox1.SelectedItem = ComboBox1.Items.Item(9)

The result is shown in the screenshot below.

```vbnet
Public Class Form1
    Private Sub Form1_Load(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles MyBase.Load
        ComboBox1.SelectedItem = ComboBox1.Items.Item(9)
    End Sub
End Class
```

In the code above, you are setting the selected item in the combo box to be the 10th item (which happens to be the number 10). Indices in VB.NET begin with zero, not one. So the first item in the combo box has an index of zero, while the last item has an index of 9 in this case.

3. At the top of the code editor, click the Form1.vb [Design] tab.

4. Double click the Calculate Average Streamflow button to open the code editor and automatically create stub code for the Click event for that button.

5. Add the following code to the btnCalculate_Click procedure.

```vbnet
    Public Class Form1
        Private Sub Form1_Load(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles MyBase.Load
            ComboBox1.SelectedItem = ComboBox1.Items.Item(9)
        End Sub
        Private Sub btnCalculate_Click(sender As Object, e As EventArgs) Handles btnCalculate.Click
            ' Code to compute average streamflow goes here
        End Sub
    End Class
```
In the code above, you are first preparing the inputs to feed the web service. The tricky part of this is formatting the dates to "yyyy-MM-dd" format (e.g., 2006-12-31), which is what the web service is expecting. Another trick is calculating the start date by adding "negative" days to the current date in the line:

```vba
tmpDate = Now.AddDays(-1 * ComboBox1.SelectedItem + 1)
```

In the code above, you are first preparing the inputs to feed the web service. The tricky part of this is formatting the dates to "yyyy-MM-dd" format (e.g., 2006-12-31), which is what the web service is expecting. Another trick is calculating the start date by adding "negative" days to the current date in the line:
Next you are creating a new instance of the NWIS Daily Values web service and calling the GetValuesObject method from the service with the date inputs from the user. This method returns an Object with the data retrieved from the web service.

Next, with the results from the GetValuesObject call, you are computing the average streamflow from the values returned, and then showing a message box to report the result.

### 2.5 Running the Code

The project is now ready to run.

1. Press F5 on your keyboard to run it.
2. Click the Calculate Average Streamflow button.

After a minute or two, a message box appears showing the average streamflow over the past 10 days. Note that your value may be different than the value in the screenshot below, since the value depends on what the streamflow was over the past thirty days when the button is clicked.

![Figure 13 Final Result](image)

3. Close the form when you are finished.

You have completed the exercise and have learned how to call a web service from Visual Studio 2008. From this point, you could build the solution as an executable file by pressing Ctrl-Shift-B on your keyboard. See your Visual Studio help for more information about building solutions.
